

ievo™ offers a range of biometric solutions to suit your every security need

Micro

The newest *ievo™* offering is the *micro™* biometric fingerprint reader which is less than half the size of the original *ultimate™* (below) yet still as feature rich.

- Using a type of multi-spectral imaging technology the *micro™* reader is a fast, accurate and reliable internal only solution.
- It will function perfectly with types of **creams and powders** on the skin, plus some types of latex gloves
- You can opt for a number of **different mounting positions** including mullion or surface, which will enable this reader to fit into the most awkward places whilst maintaining the aesthetics of your surroundings.
- Similar to the *ultimate™* reader, **spoof detection** can be enabled, giving you extra peace of mind if *micro™* was to secure a cash office or highly restricted area.

Ultimate

The dual **internal and external** biometric fingerprint reader, *ievo ultimate™* will secure any access point due to its indisputable robust exterior.

- It will maintain functionality even in the **harshest weather conditions (IP 65 Rated)** including rain, snow and direct sunlight as well as with levels of dirt, oil, grease, cream, cosmetics or latex gloves on the fingertips and with **problem fingerprints**.
- A Police forensic manufactured print could not dupe the *ievo ultimate™* reader with the **spoof detection** feature enabled. This is possible because of the industry leading multi-spectral imaging sensor coupled with a world class algorithm.
- These elements combined mean that this solution is perfect for external doors, server or cash offices, child care centres, airports, construction sites and pretty much any project needing a reliable and durable security system.

Both readers offer a unique **8,000 fingerprint capacity** and seamlessly integrate into your previous security system, meaning there is no need to replace it, this will majorly reduce disruption during installation.
